

Data handling, security, and quota statement

Man Friday (manfriday.app) · Google Cloud project 845649489196 (man-friday-508102) ·
Operated by Qash Solutions · 12 September 2026 · Contact: admin@manfriday.app

1. What Man Friday is

Man Friday is a web application for solo software builders. It reads the user's own product website, drafts short vertical videos about that product, and shows them in a swipe feed. The user approves the videos they like and schedules them. Approved videos can be published to the user's own YouTube channel as Shorts. The app is public (anyone can sign up free, no card), commercial (subscriptions), and web-only.

Google is used **only** to connect a YouTube channel for publishing. App identity is handled by Clerk (passkeys, email, Google or GitHub sign-in through Clerk). A YouTube connection is never a login.

2. YouTube API usage

Endpoint	Scope	Units	When it is called	Status
channels.list (mine=true)	youtube.readonly	1	Once, when the user connects a channel, to store the channel ID and display name.	Live
videos.insert (resumable)	youtube.upload	1,600	Once per approved video, at the time the user scheduled. One user approval = one upload.	Live
videos.list (id=...)	youtube.readonly	1	Once per day per video that Man Friday itself published, to read its view count.	Live

No other endpoints are used. In particular the app never calls search.list, never reads comments, subscribers, playlists, or analytics, and never reads any channel other than the one the user connected.

3. Data stored from YouTube API Services

Data	Where	Why	Retention
OAuth access token, refresh token	Convex database (socialAccounts table); read only inside server actions, never sent to the browser or the render worker	To upload on the user's behalf and to read stats of our own uploads	Until disconnect or account deletion. Cleared immediately on disconnect; the token is also revoked at Google.
Channel ID, channel name	Convex	Show the user which channel is connected	Until disconnect or account deletion
Per published video: YouTube video ID, title, publish time, view count	Convex (publications table)	Show publish status and performance in the user's queue and Analytics page	Until account deletion; view counts refreshed at most once per day and only while the account stays connected

Not stored: any data about videos Man Friday did not publish, other channels, viewers, comments, or subscriber lists. **Not shared:** YouTube data never reaches third parties, is never used for advertising, is never sold, and is never aggregated across users.

Authorized data older than 30 days is either refreshed (view counts) or deleted (tokens on disconnect). Stored video metadata refers only to content the user created and published through the app.

4. User control and revocation

- **Consent:** Google's consent screen shows both scopes; the user can cancel. The app does not request incremental or additional scopes later.
- **Disconnect:** Settings › Connected accounts › Disconnect. The app calls Google's revoke endpoint, sets the stored tokens to empty immediately, and deletes remaining metadata within 7 days.
- **Delete account:** Settings › Your data › Delete account removes the account, brand briefs, generated videos, and all connected-account records.
- **Google-side revocation:** the user can revoke Man Friday at any time at [myaccount.google.com › Security › Third-party access](https://myaccount.google.com/Security/Third-party-access); after that the stored token stops working, the app can no longer upload or read anything, and the user must reconnect explicitly.

- **Published videos** stay on the user's channel in all cases; the app never deletes YouTube content.

5. Security overview

Area	Control
Authentication	Clerk; passkeys and TOTP available; sessions expire after 60 minutes of inactivity.
Connect gate	A passkey or 2FA must be enabled on the Man Friday account before any social account (YouTube, TikTok) can be connected.
Token handling	Tokens live only in the Convex database (encrypted at rest by the platform) and are used only inside server-side actions. They are never returned to the browser, never logged, and never given to the render worker.
Secrets	OAuth client secret and API keys are stored as Convex / Vercel environment variables; they are not in source control.
Transport	HTTPS everywhere; OAuth redirect URI is the fixed <code>https://manfriday.app</code> callback registered in the Google Cloud project.
Least privilege	Two scopes only; endpoints listed in section 2 only; per-account scheduler so one user cannot exhaust the shared quota.
Logging and monitoring	Server logs never include tokens or YouTube data; PostHog product analytics receives no YouTube data.
Automated compliance guard	A test suite (validation/compliance) runs on every code push, on every pull request, and weekly against the live site. It fails the build if the code requests any scope or calls any endpoint outside those declared here, if a public function could return a token, if the schedule gate is weakened, or if the privacy policy or terms lose their YouTube disclosures. Changing the declared use case requires prior written notice to YouTube.
User notices	If Google stops accepting the app's access (expired or revoked), Settings and the publish queue tell the user that posting is paused and offer Reconnect; failed uploads show a plain-language reason. The app never retries an upload on its own.
Incident contact	<code>admin@manfriday.app</code> ; response within 2 business days.

6. Quota request and calculation

Assumption	Value
Cost per upload (videos.insert)	1,600 units
Plan allowances	Solo 20 videos/month · Studio 100 videos/month
Founding cohort	up to 200 paying customers
Realistic usage	~3 Shorts per customer per week → ~85 uploads/day at 200 customers
Peak factor	×2 (posting clusters at popular times)
Requested videos.insert quota	300,000 units/day (~185 uploads/day)
Requested general quota (channels.list, videos.list)	10,000 units/day
Default quota	10,000 units/day = 6 uploads/day across all customers, which blocks a paid product

We will request a further increase with actual usage data once consumption approaches 70% of the granted quota.

7. Compliance self-check (YouTube API Services Terms and Developer Policies)

Requirement	Where it is met
Privacy policy discloses use of YouTube API Services	https://manfriday.app/privacy › "YouTube" section
Privacy policy links the Google Privacy Policy	Same section, link to policies.google.com/privacy
Privacy policy explains data accessed, stored, and how users revoke	Same section: "What we access", "What we store", "Revoking access" (in-app and via Google security settings)
Terms of service bind users to the YouTube Terms of Service	https://manfriday.app/terms › "Platform terms"
Minimum scopes	youtube.upload and youtube.readonly only
No data aggregation, sale, or advertising use	Section 3 above; privacy policy
Authorized data refreshed or deleted within 30 days	Section 3 above
Users can revoke and data is deleted on revocation	Section 4 above
Branding	The product name does not contain "YouTube"; YouTube is referenced by name to describe the integration; the app does not imply endorsement by YouTube or Google
Uploads reflect user intent	Every upload follows an explicit user approval and a user-chosen schedule; no bulk or automated uploads
