How Man Friday uses Google OAuth 2.0 and the YouTube Data API v3 — data flow, storage, and revocation

## DATA FLOW

- 1 User signs in (Clerk) and opens Settings › Connected accounts › Connect YouTube.
- 2 App redirects to Google's consent screen requesting youtube.upload and youtube.readonly.
- 3 Google returns an authorization code; Convex exchanges it for tokens and calls channels.list once.
- 4 User approves videos in Picks and schedules them in Calendar — one approval = one upload.
- 5 Render worker builds the MP4 for each approved video and hands it back to Convex.
- 6 At the scheduled time a Convex action uploads the video with videos.insert to the user's own channel.
- 7 Daily videos.list refresh of the view count for videos Man Friday published — next release (dashed).
- 8 Disconnect or account deletion revokes the token at Google and deletes stored tokens + video metadata within 7 days.
